It's been said that "re-sharpened" blades often "cut better than new". Well of course there is *something* to that. Not only are the blades "razor sharp", but the cutting edge is "squared" to the cut with a face grind. Conventional blades, even "ground tooth" types, have a twist on the face. This twist pushes saw dust to the sides of the blade, rather than the center. Every tooth tip of Simonds new **PreSharp** saws are ground razor sharp and square, right at the factory.
