# INTRODUCING **SAW** "Glide"

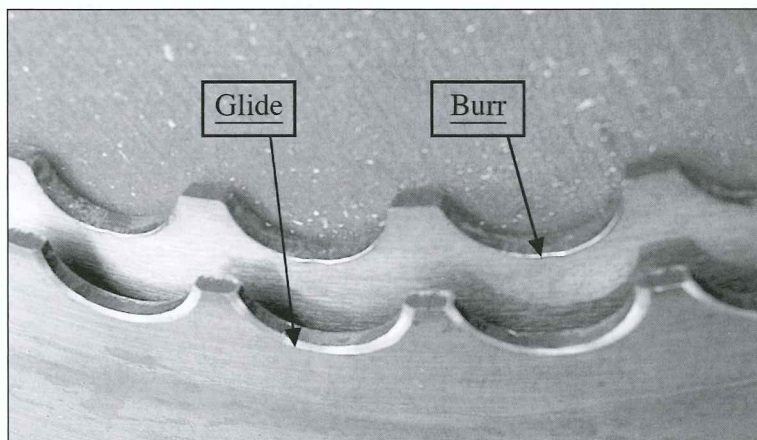

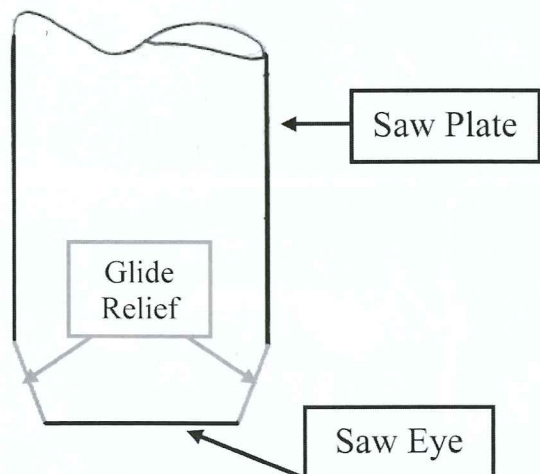

The patent pending Simonds SAW GLIDE is a process to enhance the drive area of your saws and provide the "Professional Edge!"

The SAW GLIDE is a simple effective way to eliminate the BURRS that dig into the machine arbor causing grooves that lead to poorly sized lumber and "mismatch" in a double arbor machine.

Installing SAW GLIDE results in

- safer and reduced work effort for sawfilers
- improved thin kerf sawing
- reduces sawing deviation
- reduces saw changes
- reduced arbor costs

This illustration shows two #3 retec saws, one with the burr from contact with the arbor, the second with the Glide installed.

Contact your local Simonds Representative or call Norm Brown direct for more information at 978-424-0707 or email [nbrown@simondsint.com](mailto:nbrown@simondsint.com)
